Subscriptions and back-issues

A year's subscription to *DB2 Update*, comprising twelve monthly issues, costs \$380.00 in the USA and Canada; £255.00 in the UK; £261.00 in Europe; £267.00 in Australasia and Japan; and £265.50 elsewhere. In all cases the price includes postage. Individual issues, starting with the January 2000 issue, are available separately to subscribers for \$33.75 (£22.50) each including postage.

DB2 Update on-line

Code from *DB2 Update*, and complete issues in Acrobat PDF format, can be downloaded from our Web site at <http://www.xephon.com/db2>; you will need to supply a word from the printed issue.

Providing a portable and customized Control Center in DB2 Universal Database Version 8.2

The IBM DB2 Universal Database for Linux, Unix, and Windows Version 8.2 product (DB2 UDB v8.2) delivers countless new features for database administrators (DBAs) and application developers alike. Before the DB2 UDB v8.2 release, the Control Center provided a complete range of functionality and features for all users, regardless of their skill sets. For inexperienced DBAs or power users, the complete range of the Control Center's functionality presented all at once could complicate the navigation of the Control Center and make task execution less efficient.

The DB2 UDB v8.2 release adds 'personas' to the Control Center to simplify navigation and complexity for those users who don't need an all-encompassing total management tool. Using a persona, users can personally customize the Control Center capabilities so they can accomplish their tasks more

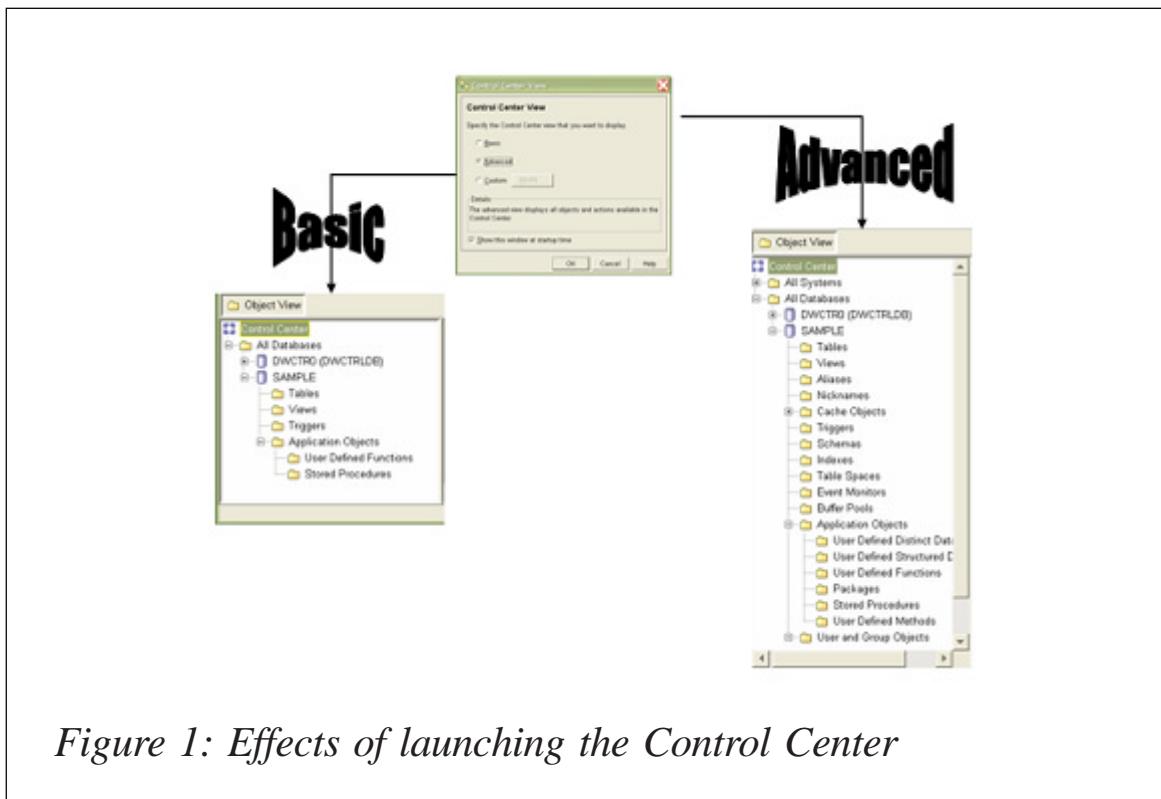

Figure 1: Effects of launching the Control Center

easily and navigate the Control Center more efficiently.

Figure 1 shows the effects of launching the Control Center in DB2 UDB v8.2 in both the Basic and Advanced personas.

You can see the differences between the two personas in Figure 1. The Basic persona lists the databases that are available for administration and applies the 80/20 rule with respect to the objects that you can work with. On the other hand, the Advanced persona lists both system servers and every object of a database that you can work with. (Note that to view a list of all the objects that you can work with in a database requires the use of a scroll bar.)

When you start the Control Center in DB2 UDB v8.2, you can set the views for Basic, Advanced, and Custom functionality. (You can disable this option so that personas can be set using only the **Tools/Customize Control Center** function in the Control Center's action menu bar.)

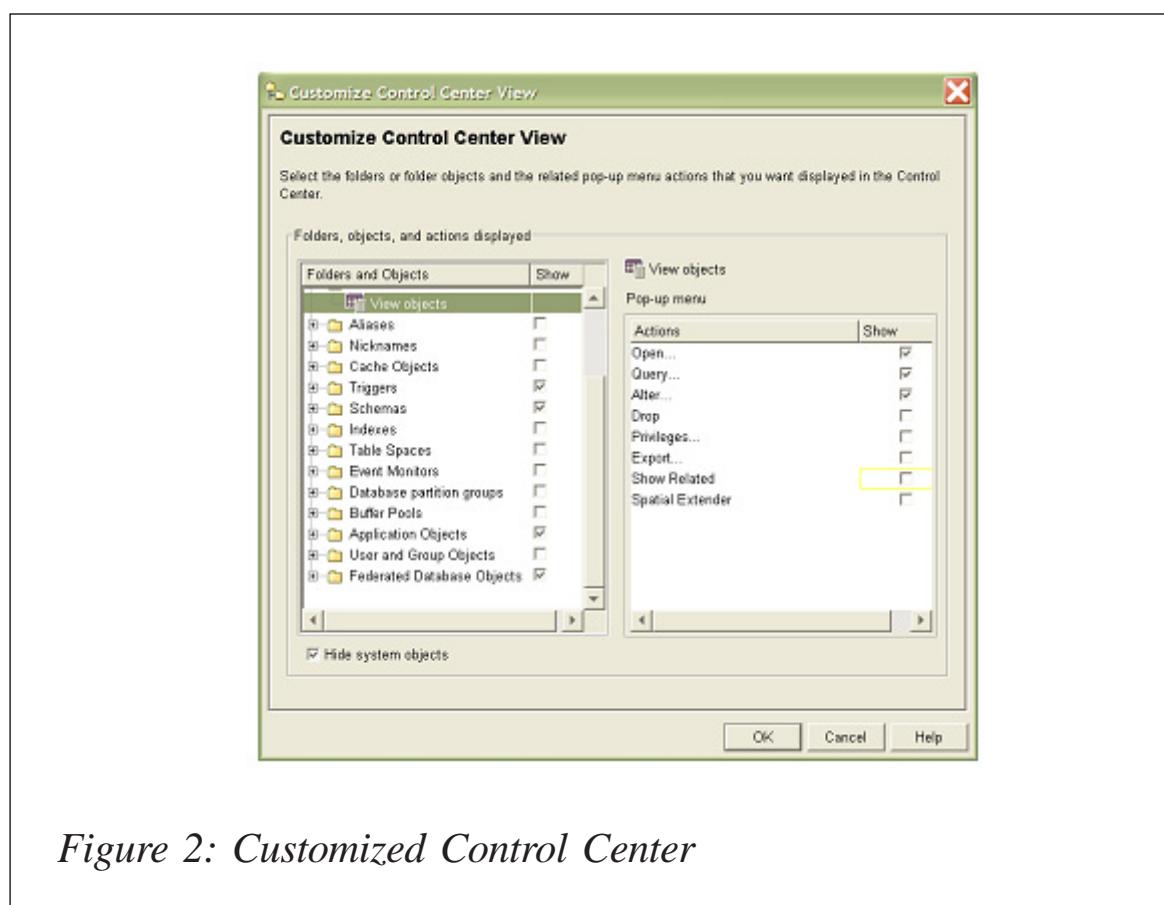

Figure 2: Customized Control Center

The Custom functionality allows you to tailor the view of the Control Center to match your needs. For example, let's assume that you are a DBA who wants the simplicity of the Basic persona, but you also use WebSphere Information Integrator to work with a Microsoft SQL Server database that resides in your network. To satisfy this requirement, you can customize the Control Center so that it shows all of the objects in the Basic persona and any federated database objects you may have defined on your system.

Using a custom approach, you can customize not only the objects that appear in the Control Center but also the actions that you can perform on them. In Figure 2, I've configured the Control Center to match the Basic persona, but customized it so that I can work with federated database objects, and limited some of the actions I can perform on views that are not part of the Basic persona configuration.

In short, the persona feature of the Control Center allows users to:

- 1 Assume different personas (Basic, Advanced, and Custom)

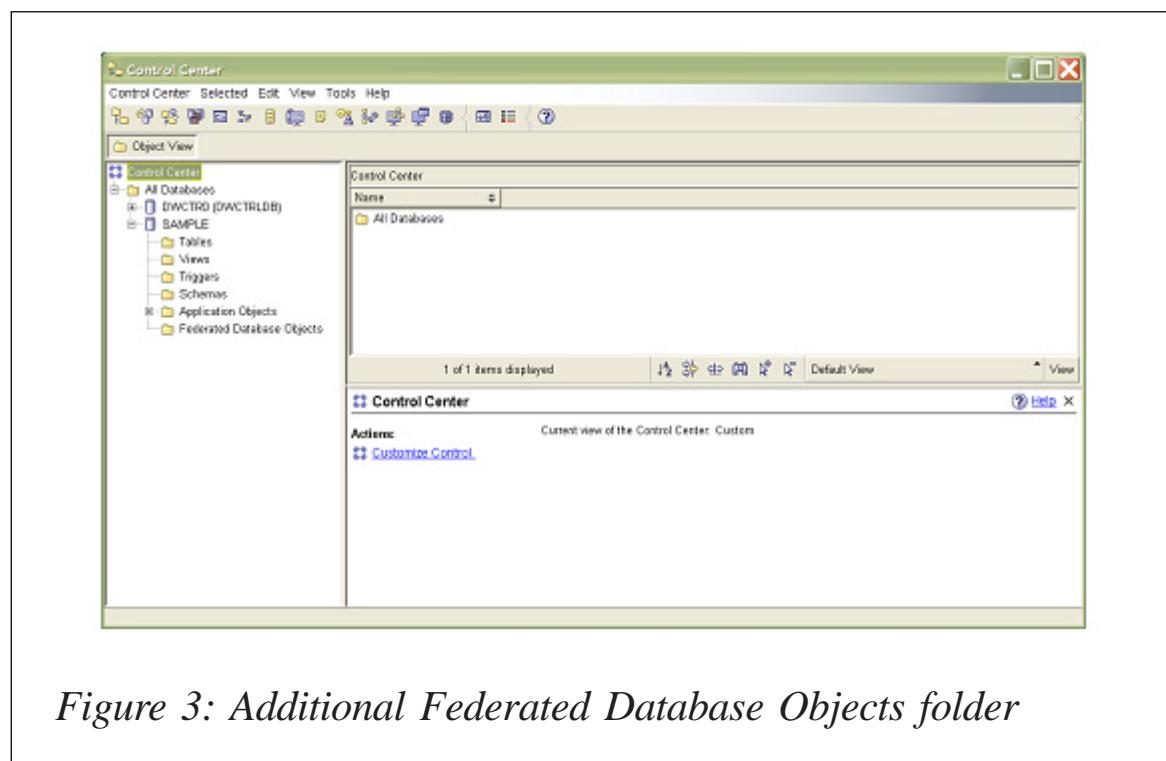

Figure 3: Additional Federated Database Objects folder

and pick the one that best suits their needs.

- 2 Enjoy simplified and improved Control Center navigation.
- 3 Choose to create a hybrid persona using the Custom persona.

After you customize the Control Center view and actions that can be performed there, it will display the objects you defined in this persona until you select a different persona or change your customization. In Figure 3, you can see the additional Federated Database Objects folder.

While this functionality is powerful indeed, there is no documented way to replicate your customizations across different servers. You may be deploying the Control Center as an administration point for a group of junior DBAs and want to restrict the actions that they can perform from this interface, or perhaps you are an Independent Software Vendor (ISV) who builds applications that run on DB2 UDB and you want to

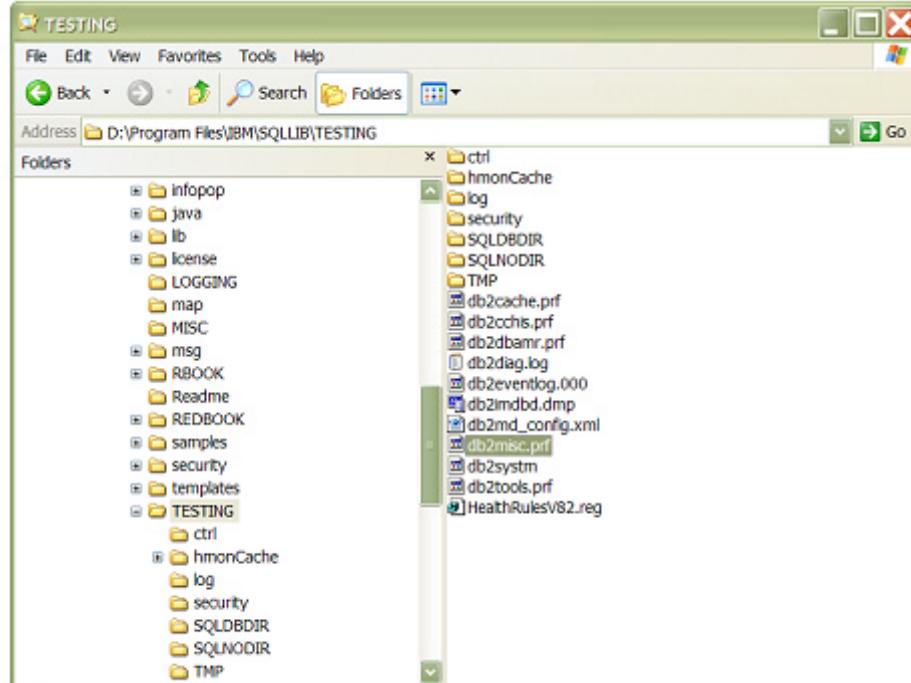

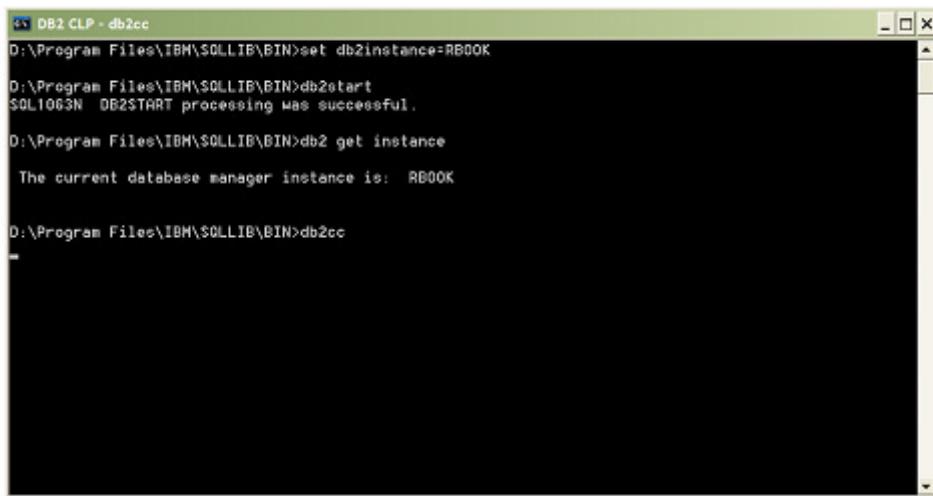

Figure 4: db2misc.prf file location

```

DB2 CLP - db2cc
D:\Program Files\IBM\SQLLIB\BIN>set db2instance=RB00K
D:\Program Files\IBM\SQLLIB\BIN>db2start
SQL1063N DB2START processing was successful.

D:\Program Files\IBM\SQLLIB\BIN>db2 get instance
The current database manager instance is: RB00K

D:\Program Files\IBM\SQLLIB\BIN>db2cc
-
```

Figure 5: Starting the new instance

customize the Control Center so that the DBAs would be exposed only to objects that you want them to work with. In neither case is your customization officially reproducible.

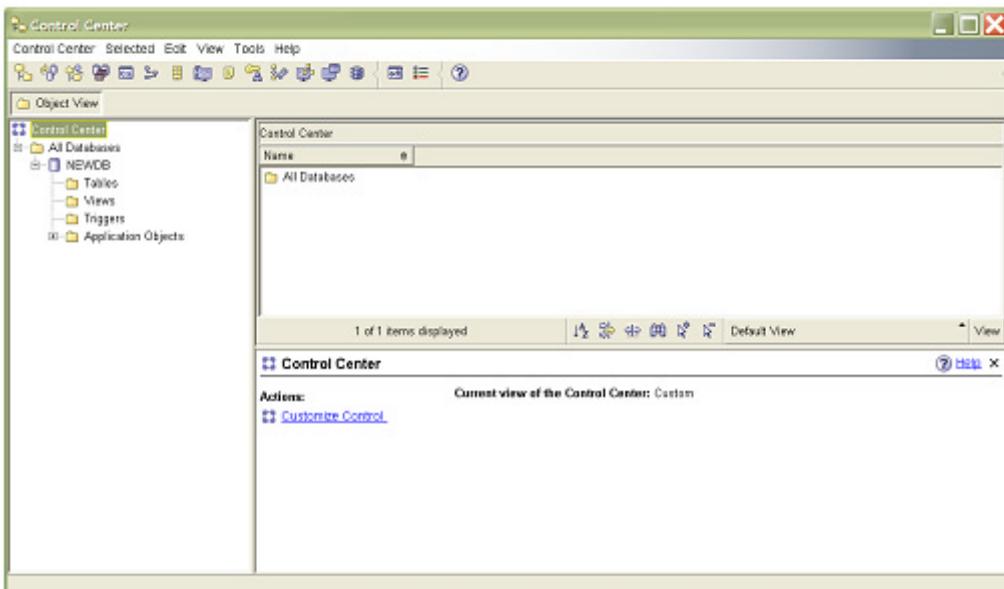

Figure 6: Duplicating customization

DB2 UDB v8.2 has no support for Custom profile importing and exporting; however, most of the Control Center's persona information is stored in the db2misc.prf file. You can find this file in your instance's directory under the <database_path>\sqllib\ directory. For example, in Figure 3, I customized the Control Center for the TESTING instance, and the db2misc.prf file therefore resides in the sqllib\TESTING\ directory, as shown in Figure 4.

If you take the db2misc.prf file and copy it to another instance directory (on the same server or a different one) you can take with it the customized persona that you've defined.

For example, on a separate server in an instance called RBOOK, I overwrote the db2misc.prf file in the appropriate directory and started the Control Center. As you can see in Figures 5 and 6, the customizations I made for the TESTING instance were duplicated in the RBOOK instance, even though it has a completely different database structure. In fact, I didn't even have to take down the instance for the changes to take effect.

CUSTOMIZE ME

While the movement of customized personas for the Control Center is not a documented or supported feature (which is why I used the word 'most' when describing the content of the db2misc.prf file), you may find the information in this article is just what you've been looking for if you're taking advantage of this new feature in DB2 UDB v8.2.

Because the solution that I suggest you try simply involves the movement of a preference file, it can be automated by a script file that you can PUSH or PULL using distributed software or applied as part of a post-installation script with your software. It may even be the case that you want to have your profile for use on whatever systems you might be administering if you're a consultant. Whatever way you choose to leverage this functionality, I'm sure you will find this undocumented trick helpful.

One more thing, just in case... Before you copy in your version of the db2misc.prf file, rename the old one to db2misc.prf.old – that's just good practice.

DSNWSPM – a useful but undocumented stored procedure

DSNWSPM is a nice, useful, but undocumented stored procedure—at least for DB2 V7. DSNWSPM returns information about resources that are used by a thread. You have to call DSNWSPM twice. The first call sets the initial values. The second call returns performance information. Between the two calls you have to place your SQL that you want to measure.

DSNWSPM returns CPU time, lock wait time, number of getpages, and number of I/Os. You have to consider the second call's values as net cumulative changes. When you run the REXX you will see the performance information at the end of the output:

```
-----  
          PERFORMANCE INFORMATION (Second Call)  
-----  
CPU time (Ext.format)      : 00:00:00.005536  
Lock/latch cont.wait time (Ext.format) : 00:00:00.000053  
Time as integer in hundredths of a sec : 0  
Lock/latch cont.wait time (Integer)   : 0  
Number of getpages (Integer)        : 63  
Number of read I/O operations (Integer) : 1  
Number of write I/O operations (Integer) : 0  
-----
```

To run DSNWSPM you have to:

- 1 Create and grant the DSNWSPM stored procedure:

```
CREATE PROCEDURE SYSPROC.DSNWSPM  
(
```

```

    INOUT  INIT_CPU_TIME      CHAR(8),
    INOUT  INIT_LOCK_TIME    CHAR(8),
    OUT    CPU_TIME_EXT      CHAR(15),
    OUT    LOCK_WAIT_TIME_EXT CHAR(15),
    OUT    CPU_TIME          INTEGER,
    OUT    LOCK_WAIT_TIME    INTEGER,
    OUT    GETPAGE_COUNT     INTEGER,
    OUT    READ_IO_COUNT     INTEGER,
    OUT    WRITE_IO_COUNT    INTEGER
)
EXTERNAL NAME DSNWSPM
LANGUAGE ASSEMBLE
NO WLM ENVIRONMENT
COLLID DSNWSPM
;
GRANT EXECUTE ON PROCEDURE SYSPROC.DSNWSPM TO PUBLIC;

```

2 Transfer the REXX to your TSO environment:

```

/* REXX **** */
/* This rexxy calls DSNWSPM stored procedure. */
/*
/* DSNWSPM is called twice.
/* First call is for setting the initial values.
/* Second call returns performance information.
/* Between the two calls you have to place your SQLs which you
/*                               want to measure.
/* SSID must be changed to your own DB2 member name.
/*                               Serdar Sabri OZKUBULAY

Move data across DB2 subsystems to another LPAR

Moving data across different databases and different platforms has been a common task in IT environments. By moving data we mainly refer to the task of copying data from a source system to a target system. There are many useful utilities for moving data with DB2 UDB for z/OS:

- DSN1COPY is a stand-alone utility for copying table spaces from the DB2 VSAM datasets or from the DB2 image copy datasets.
- DSNTIAUL is a dynamic sample SQL unload program. This program unloads the rows in a form that is compatible with and generates control statements for the Load utility.
- The DB2 Reorg utility with the REORG UNLOAD EXTERNAL option unloads data in a format usable by the Load utility.
- The Unload utility unloads DB2 data to sequential datasets. The source can be DB2 table spaces or DB2 Image Copy datasets. With Unload, you can also select columns by using the field specification list. The output records written by the Unload utility are compatible as input to the Load utility; as a result, you can reload the original table or different tables.
- The DB2 Load utility populates DB2 tables with data from a sequential dataset.
- The DB2 Cross Loader option allows you to transfer data from one location for loading a DB2 table to another location within a single utility job. The data is read from the source location with a dynamic SQL statement (EXEC SQL utility) and loaded into a table at the target location by the Load utility.

In my scenario, I move data from one table residing in one DB2 subsystem in LPAR MVSLJ to one target table residing in another DB2 subsystem in LPAR MVSMB. The prerequisite is that you need to have at least a select privilege on the source table and an update privilege on the target table on the other subsystem. This uses REXX procedures ULLR and ULLMR. The ULLMR procedure uses the Unload and Load utility and generates a single JCL job. The job should be submitted at the source site, LPAR MVSLJ.

The single JCL job has four steps at the source site, LPAR MVSLJ, and three steps at the target site, LPAR MVSMB.

Step1 deletes working datasets for output data and control statements for the Load utility (SYSREC and SYSPUNCH).

Step 2 unloads the rows and generates control statements for the Load utility.

Step 3 edits the control statements (PUNCH dataset) with additional options for the Load utility.

Step 4 generates a new JCL job, and submits it (option SYSOUT=(A,INTRDR)), using PL/I program PXMIT.

This new JCL job is submitted automatically at source site LPAR MVSLJ, but statement /*XMIT MVSMB transmits the input stream records from LPAR MVSLJ to LPAR MVSMB. The JCL job in LPAR MVSMD is also submitted automatically.

The first step (LOAD1) in LPAR MVSMB loads data in the target table. The SYSREC and SYSIN datasets should be accessible from both LPARs. The next steps (CHECKP and REPAIR) are optional. The step CHECKP searches, using PL/I program PTSCP, the table spaces in CHECK PENDING, and step REPAIR forces these table spaces to have READ/ WRITE status.

The example JCL is for a single job:

```
/*-----  
/* STEP 1: DELETE WORKING DATASETS */  
/*-----
```

```

//STEP1      EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=*
//SYSIN    DD   *
    DELETE DB2MB.UNLOAD.TABLE.*
    DELETE DB2MB.PUNCH.TABLE.*
    SET MAXCC=0
/*
-----*/
/* STEP 2: UNLOAD NADI.TAB01    LPAR: MVSLJ
/*

DB2 news

AquaFold has announced Version 4.0 of its Aqua Data Studio software, which allows administrators to visually manage the security of any relational database.

Version 4.0 can manage the security of users, roles, and object permissions. The product contains a number of different customization features that enable users to configure the tool more precisely so as to better fit their application needs, they claim. The updated version also has customization capabilities for auto completion, syntax colouring, and data retrieval.

The company has added a wizard to the product's export tool that can extract and export data from any relational base, including DB2, SQL Server 2005, and MySQL 4.1.

For further information contact:

Daffodil Software has announced Version 1.6 of Daffodil Replicator, its open source data replication tool equipped with DB2 support. This version also provides for increased performance and high data availability.

Replicator is an enterprise-wide data replication solution that eliminates the complexity of sharing information across heterogeneous operating systems and databases.

It mirrors business-critical data and generates multiple copies for high data accessibility. Its bi-directional replication capabilities allow remote clients to synchronize with data changes in the corporate database.

The enhancements in V1.6 are the result of mutual efforts by Daffodil Software and the open source community. It is now possible to merge data between DB2 and heterogeneous remote database servers (Oracle, SQL Server,

PostgreSQL, Daffodil DB, and Derby) running in distributed environments.

For further information contact:

Ingrian Networks has announced Release 4.0 of the Ingrian DataSecure Platform, its way of encrypting and securing critical data in applications and databases. DataSecure is a network-available device that can interface at any one of three layers: the Web layer, the application layer, or the database layer. The new release boosts scalability, improves performance, and offers increased administrative controls.

It supports Java, Microsoft and C/C++ applications, and comes complete with enhanced database integration tools for DB2, Oracle, and MS SQL.

Several flaws have been discovered in DB2 UDB that can be exploited to cause DoS attacks, to reveal sensitive information, to read and manipulate file content, or to compromise vulnerable systems.

IBM advises DB2 UDB administrators to upgrade all DB2 client, server and Connect gateway instances on all supported platforms to DB2 UDB Version 8.1 FixPak 8 as soon as possible. The only exceptions are DB2 UDB client instances on Version 8.1 FixPak 6a, 6b or 7a, which don't need to move up to the FixPak 8 level.

For further information contact your local IBM representative.
